HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

DETAILED ACTION

Allowable Subject Matter

Claims 56-90, 102-106, 113-115, and 117-120 are allowed.

The prior art references do not disclose or suggest the claimed inventions.

Regarding claim 56, Bergh et al discloses device for the parallel conduct or study of chemical reactions (see Abstract), comprising the following components: (a) at least two spatially separated reaction spaces (600), each of which has an input side and an output side; and (b) on the reaction space input side, at least one common educt feed (510) for the reaction spaces according to (a), or for subsets of them.

The prior art reference does not disclose or suggest the limitation of (d) on the reaction space output side, at least one connection per reaction space to at least one holding gas feed common to all the reaction spaces, or subsets of them and (e) on the reaction space output side, and downstream of the connection to the holding gas feed according to (d) in the product flow direction, at least one restrictor per reaction space.

Regarding claim 72, Bergh et al discloses device for the parallel conduct or study of chemical reactions (see Abstract), comprising the following components: (a) at least two spatially separated reaction spaces (600), each of which has an input side and an output side; and (b) on the reaction space input side, at least one common educt feed (510) for the reaction spaces according to (a), or for subsets of them.

The prior art reference does not disclose or suggest the limitation of (d) on the reaction space output side, at least one connection per reaction space to at least one

holding gas feed common to all the reaction spaces, or subsets of them; (d') on the reaction space output side, at least one connection per reaction space to at least one control fluid common to all the reaction spaces; and (e) on the reaction space output side, and downstream of the connection to the holding gas feed according to (d) in the product flow direction, at least one restrictor per reaction space.

Regarding claim 102, Bergh et al discloses device for the parallel conduct or study of chemical reactions (see Abstract), comprising the following components: (a) at least two spatially separated reaction spaces (600), each of which has an input side and an output side; and (b) on the reaction space input side, at least one common educt feed (510) for the reaction spaces according to (a), or for subsets of them

The prior art reference does not disclose or suggest the limitation of (b'') on the reaction space input side and as part of the connections of the common educt liquid feed to the reaction spaces according to (a), at least one restrictor per connection; (e') on the reaction space output side and downstream of a connection to an optional control fluid feed, in the flow direction of at least one reaction product, at least one gas-liquid separation unit per reaction space; (e'') associated with each gas-liquid separation unit, a connection for discharging at least one reaction gas; (e''') per connection according to (e'') and via a node/mixing point, a connection to a common holding gas feed; and (e''') after the nodes according to (e'''), downstream in the flow direction of the reaction gas, but before an optional analysis unit, at least one restrictor per connection according to (e'), configured to keep pressure constant in all the reaction spaces even if volume fluctuations occur in the reaction spaces.

Regarding claim 113, Bergh et al discloses a device for the processing or testing of at least one chemical reaction, comprising: a unit for the controlled discharge of product fluid out of at least one high pressure end reaction vessel (600), wherein said reaction vessel is in fluid connection, with a collecting area (520) that is at a lower pressure than the high pressure reaction vessel (see column 13, line 27 through column 14, line 6 and figure 1A).

Bergh et al does not disclose a fluid separation unit and said fluid separation unit is in fluid connection, via a discharge valve, with a collecting area.

Karlsson et al discloses that the plurality of effluents generated are further process by, for example, separating the effluents (see column 3, lines 53-61 and column 8, lines 29-57), a sample valve (20) is at a reduced pressure as compared to the pressure in lines (16) (see column 7, lines 47-67), and the selected effluent is directed to a processing device (28), which is interpreted as a collecting area (see column 8, lines 29-57).

The prior art references do not disclose or suggest a device wherein the collecting area for the product fluid is a fluid separation unit located at the low pressure end with respect to the high pressure end fluid separation unit.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See Sugarman et al (US 5,503,805), Hindsgaul et al (US 6,723,235), and Chatelain et al (US 6,623,703).
